Fallopian Tube Cancer Overview

Fallopian Tube Cancer is a rare malignancy that originates in the fallopian tubes, the slender ducts connecting the ovaries to the uterus. Most cases are epithelial in origin, arising from the cells lining the inner surface of the tubes. Symptoms may include abdominal pain, abnormal vaginal bleeding, and pelvic masses. Diagnosis often involves imaging studies, such as ultrasound or MRI, followed by biopsy for confirmation. Treatment typically involves surgery to remove the affected fallopian tube and often the ovaries and uterus as well, known as a total abdominal hysterectomy with bilateral salpingo-oophorectomy. Chemotherapy may be recommended post-surgery to target any remaining cancer cells and reduce the risk of recurrence. Prognosis varies depending on factors such as the stage of cancer at diagnosis and the effectiveness of treatment. Early detection and prompt intervention are crucial for improving outcomes in fallopian tube cancer cases.
