According to the World Health Organization (WHO) report on Infection Prevention and Control in 2022, out of every 100 patients in acute care hospitals, seven patients in high-income countries and about 15 patients in low- and middle-income countries will acquire at least one healthcare-associated infection (HAI) during their hospital stay. They are nosocomial infections that occur during a patient's stay in hospitals and related facilities and are not observed at the time of admission. These infections include central line-associated bloodstream infections, surgical-site infections, catheter-associated urinary tract infections, hospital-acquired pneumonia, ventilator-associated pneumonia, and Clostridium difficile infections. The most common bacteria associated with HAIs include C. difficile, MRSA, Klebsiella, E. coli, Enterococcus, and the Pseudomonas species. Using infected medical devices during diagnostic and therapeutic procedures is a major cause of HAIs.

Emerging economies such as India, China, Brazil, Russia, and countries in Latin America and Southeast Asia are expected to provide significant growth opportunities to players operating in this market. Over half the world's population resides in India and China, making these markets home to a large patient population. Public pressure to improve the quality of hospital care, the increased cost of HAIs in healthcare systems, the emergence of multi-drug-resistant microorganisms, and the initiatives of government authorities play an important role in the growth of the global market in these countries. In the past few years, medical device manufacturing has witnessed significant growth in the Asia Pacific region. The current development trends among players indicate even greater potential in the coming years. This can be attributed to technological advancements, the growing disease burden, and the increasing number of surgeries performed in this region.

Some reusable medical devices include surgical forceps, endoscopes, and stethoscopes. But, there are concerns about the safety and performance of reprocessed devices. There has been a paradigm shift in the reprocessing of medical devices, with increased emphasis on the quality management systems approach that requires validated sterilization instructions from
