Overt Hepatic Encephalopathy Overview

Hepatic encephalopathy (HE) is a brain disorder that develops in some individuals with liver disease. HE presents as a spectrum of neuropsychiatric symptoms ranging from subtle fluctuating cognitive impairment to coma and is a significant contributor to morbidity in patients with liver disease. It is observed in acute liver failure, liver bypass procedures – for example, shunt surgery and trans-jugular intrahepatic portosystemic shunt – and cirrhosis, classified as Type A, B, and C HE, respectively. Pathogenesis is linked with ammonia and glutamine production

Overt Hepatic Encephalopathy Treatment Landscape

Overt Hepatic Encephalopathy management includes treating patients with acute HE episodes, preventing HE recurrence, and identifying and managing precipitating factors associated with HE development. The two primary forms of medical therapy for HE are nonabsorbable disaccharides (i.e., lactitol and lactulose) and nonabsorbable antibiotics (i.e., rifaximin). The hyperammonemia and inflammation that occurs due to urea breakdown in cirrhotics have led to the development of HE treatments that target gut bacteria. Overt Hepatic Encephalopathy treatment approved by the USFDA and some unapproved treatments are available for use. It is important to remember that in patients with cirrhosis and portosystemic shunting, skeletal muscle mass and renal clearance are vital to neurotoxin clearance.

Overt Hepatic Encephalopathy Marketed Drugs

- Xifaxan: Salix Pharmaceuticals/Bausch Health

Xifaxan (rifaximin) tablets (550 mg) developed and marketed by Salix Pharmaceuticals (a subsidiary of Valeant Pharmaceuticals), were indicated for the reduction in risk of Overt Hepatic

Encephalopathy (HE) recurrence in patients ≥ 18 years of age. It is also being marketed to treat Travelers' Diarrhea and IBS-D (Irritable Bowel Syndrome with Diarrhea). Salix is exploring the potential additional indications, formulations, and clinical trials, and co-promotion arrangements for Xifaxan to capitalize on the potential for Xifaxan, including development programs in Crohn's disease and liver disease.

Overt Hepatic Encephalopathy Emerging Drugs Profile

- AXA1665: Axcella Health, Inc.

AXA1665—Axcella's product candidate for a reduction in risk of recurrent Overt Hepatic Encephalopathy—is a composition of eight amino acids and derivatives designed to target multiple metabolic pathways intersecting key organ systems, including the liver, muscle, and gut. In prior clinical studies, this oral product candidate was safe, and well-tolerated, and demonstrated the potential to improve ammonia handling, physical function, amino acid balance, and neurocognition with a safe and well-tolerated profile. Axcella conducted two studies for AXA1665: AXA1665-001 and AXA1665-002.

- GR3027 (Golexanolone): Umecrine Cognition

Umecrine Cognition, a Karolinska Development (KDEV), is developing novel GR3027 (golexanolone), an orally administered small molecule to treat patients diagnosed with HE. Golexanolone is a GABAA-receptor modulating steroid antagonist (GAMSA) designed to antagonize positive GABAA-receptor modulation by endogenous neuroactive steroids.
