Hepatitis D Overview

Hepatitis D, also referred to as delta hepatitis, is a liver infection instigated by the Hepatitis D virus (HDV). It's categorized as a satellite virus because it necessitates the presence of the Hepatitis B virus (HBV) to replicate and induce infection. HDV infects individuals either concurrently with HBV (co-infection) or subsequent to HBV infection (superinfection).

HDV is the root cause of Hepatitis D, a condition that solely affects individuals already harboring HBV. Transmission of HDV occurs through contact with infected blood or bodily fluids, mirroring the transmission routes of HBV. Common risk factors for acquiring Hepatitis D include injection drug use, exposure to infected blood, or engaging in unprotected sexual activity with an individual infected with HBV/HDV.
