Single Ventricle Heart Disease Market Insights

Various types of single ventricle heart defects are very different, and treatment for each must be customized. Many patients with single ventricle defects may also require a cardiac catheterization during childhood. Even though the types of defects are different, the general treatment approach for single ventricle heart defects is similar. Single ventricle defects require a series of open-heart procedures, performed over several years. This is called “staged reconstruction” and includes three surgeries: The Norwood procedure, The hemi-Fontan or Glenn operation, The Fontan procedure. During this series of operations, surgeons reconfigure the heart and circulatory system.

Single Ventricle Heart Disease Therapeutics Market

The burden of Single Ventricle Heart Disease is objectively significant, there is a shocking lack of data available on long-term outcomes and economic impact, with no comprehensive resource that describes the full spectrum. Therefore, efforts to describe the effects of this disease rely heavily upon data compiled on generalized CHDs to describe the effects of this disease, which fail to account for the specificity and extent of impacts unique to Single Ventricle Heart Disease.

Single Ventricle Heart Disease Market Dynamics

The Single Ventricle Heart Disease market dynamics are anticipated to change in the coming years owing to the increasing R&D activities, and expected launch of emerging therapies during the forecasted period 2023–2034. The approval of the emerging treatments will be a milestone for patients who have been suffering from single ventricle heart disease.

Single Ventricle Heart Disease Drugs Uptake

- Udenafil: Mezzion Pharma Co. Ltd

Udenafil is a long acting highly selective phosphodiesterase-5 inhibitor that is orally administered. Inhibition of PDE5 results in the relaxation of pulmonary vascular smooth muscle cells and vasodilation of the pulmonary vascular bed. In 2021, Mezzion announced positive data from a Phase III efficacy and safety trial (FUEL Trial) and its open label extension trial (FUEL OLE Trial) that concerns the treatment of a very large subgroup of patients with congenital single ventricle heart disease (SVHD) who have Fontan physiology was presented to the FDA in a Type C meeting.

- JRM-001: Metcela Inc.

JRM is developing a new cell therapy product JRM-001 for serious cardiac diseases, namely pediatric congenital heart disease, using cardiac stem cells (CSCs). JRM-001 is targeting single ventricle, which is one of the most common pediatric congenital heart diseases affecting about 400-500 patients annually. Currently JRM-001 is going through Phase III APOLLON clinical trial in Japan to evaluate the improvement of cardiac function after standard surgical repair of the heart.
