Cannabis Use Disorder Overview
Cannabis (also called marijuana) is the third most commonly used psychoactive substance worldwide, after alcohol and tobacco (nicotine). Cannabis can be administered by various methods including smoking, vaping, dabbing, ingesting (edibles, beverages, and tinctures), and topical cream. The continued use of cannabis despite impairment in psychological, physical, or social functioning is termed as Cannabis use disorder (CUD) or Cannabisab use. v CUD develops in approximately 10% of regular cannabis users and up to 50% of chronic daily users. Cannabis use and CUD are associated with adverse consequences, including cognitive decline, impaired educational or occupational attainment, impaired driving ability, emergency room visits, psychiatric symptoms, poor quality of life, other drug use, and risk of addiction or substance use disorders.
