The stage (extent) of breast cancer is an essential factor in making treatment decisions. Most women with breast cancer in Stages I, II, or III are treated with surgery, often followed by radiation therapy. Most women with breast cancer in Stages I-III will get some drug therapy as part of their treatment. This may include chemotherapy, hormone therapy (tamoxifen, an aromatase inhibitor, or one followed by the other), HER2 targeted drugs, such as trastuzumab (Herceptin) and pertuzumab (Perjeta), and some combination of these. The drugs that might work best depend on the tumor's hormone receptor status, HER2 status, and other factors.
