This report studies the 5-hydroxymethylfurfural (5-HMF) (CAS 67-47-0) market. Hydroxymethylfurfural (HMF), also 5-(hydroxymethyl) furfural, is an organic compound formed by the dehydration of certain sugars. It is a white low-melting solid (although commercial samples are often yellow) which is highly soluble in both water and organic solvents. The molecule consists of a furan ring, containing both aldehyde and alcohol functional groups. HMF can form in sugar-containing food, particularly as a result of heating or cooking and this formation has been the topic of significant study as HMF is regarded as being potentially carcinogenic to humans. Hydroxymethylfurfural is a marker of poor or overlong storage of foods such as honey. It is produced industrially on a modest scale as a carbon-neutral feedstock for the production of fuels and other chemicals.

This report aims to provide a comprehensive presentation of the global market for 5-hydroxymethylfurfural (5-HMF), with both quantitative and qualitative analysis, to help readers develop business/growth strategies, assess the market competitive situation, analyze their position in the current marketplace, and make informed business decisions regarding 5-hydroxymethylfurfural (5-HMF).
