

Red Meat Lover's Club Hosts Charity 'Meating' at New York Prime Steakhouse Boca Raton

Event Raised More than \$50,000 for the Jordan Avi Ogman Foundation to Save 8-Year-Old's Life

BOCA RATON, FL, UNITED STATES, July 11, 2024 /EINPresswire.com/ -- The Red Meat Lover's Club (RMLC), a South Florida-based business dining club, hosted a charity dinner on July 9 at New York Prime Steakhouse in Boca Raton. The "Meating" raised more than \$50,000 for the [Jordan Avi Ogman Foundation](#), which was created by David and Stacey Ogman to save the 8-year-old's life after being diagnosed with TECPR2, a rare, fatal genetic brain disorder. The goal of the foundation is to raise both awareness and funds to find a cure for the disease, which currently has no way of being treated.

“

We were honored to work with David and Stacey to host this event for their son. Jordan's rare neuro genetic disease needs immediate funding now. It will take our whole village to help find this cure.”

Evan Darnell, Founder of Red Meat Lover's Club

The event featured all-you-can-eat prime beef and both live and silent auctions. The Red Meat Lover's Club frequently works with South Florida charities to host "meetings" that serve as fundraisers for a good cause.

“We were honored to work with David and Stacey to host this event for their son,” said Evan Darnell, Founder of Red Meat Lover's Club. “Jordan's rare neuro genetic disease needs immediate funding now. It will take our whole village to help find this cure.”

The Jordan Avi Ogman Foundation

The Jordan Avi Ogman Foundation was created to save 7-

year-old Jordan Avi Orgman's life by his parents, David and Stacey Ogman. After years of struggling and delayed development, Jordan was diagnosed with TECPR2, a fatal,

neurodegenerative, debilitating, genetic disease and the clock is ticking. Saving the lives of Jordan and the other children with TECPR2 can potentially lead to breakthroughs for other neurodegenerative diseases of the brain. TECPR2 and many well-known neurodegenerative diseases of the brain—such as ALS, Parkinson’s disease, and Alzheimer’s—are suspected to share a commonality of failure, impairment, and/or abnormalities of the autophagy (the body’s way of cleaning out damaged cells in order to regenerate newer, healthier cells) process.
