Definition:
A Postal Automation System is a technological infrastructure designed to optimize and streamline mail handling tasks. Sorting, canceling, and distributing mail required a lot of manual labor in the past for postal operations. But postal services have embraced technology to increase speed, accuracy, and efficiency since automation was introduced. Additionally, these systems automate many mail processing steps using a combination of hardware and software. One example of an automated sorting method is the use of Optical Character Recognition (OCR) technology to read addresses from mail. Modern sorting machines can process enormous amounts of mail quickly, greatly cutting down on processing time. Furthermore, real-time mail item monitoring is made possible by barcode scanners and tracking devices, which provide crucial logistics data.
