Definition:

A train's railway wheel is an essential part that helps it run over the rails smoothly and steadily by supporting the weight of the vehicle. These wheels, which are usually constructed of steel, are carefully engineered to withstand the significant strains and abrasions brought on by continuous contact with the rails. The conical shape of the wheel helps with smooth turning on curving tracks, and the flange keeps the wheel adjusted on the rails, preventing derailment. In addition, railway wheels are frequently heat-treated to improve their toughness and capacity to withstand splitting under heavy loads and rapid acceleration. To ensure the wheels' consistent quality and security during railway operations, proper maintenance and routine inspections are necessary.
