customize export settings to ensure the final output meets their specific requirements.

Create motion graphics effortlessly with SVGator, then export your animations in various formats:

.SVG extension files: Export your files as .svg to retain quality and scalability for web use. SVG files, ideal for vector-based web graphics, can be animated using JavaScript or CSS. Choosing between JavaScript and CSS often depends on the type of animations and the level of interactivity required. CSS works well for simple animations, while more complex, interactive animations may need JavaScript for greater control and functionality.

Lottie JSON: The simplest method for animating Lottie also offers the most direct approach for exporting Lottie files. With SVGator's Optimized JSON setting, you can decrease the file size by up to 70% through efficient JSON structure optimization.

.JS extension files for React Native: Avoid the time-consuming development process with a flexible React Native animation tool that makes it easy to create animations for all Android and iOS versions. Your web animation will look the same in your mobile app as it does on a website, without needing any third-party apps or plugins.

.DART with mobile export for Flutter: Get exactly what you need: advanced custom Flutter animations in minutes, ready for immediate use. Simply export your SVG animation as .dart, install Flutter webview, and embed the file. You can create complex Flutter animations that you can fully control programmatically using our Player API.

Video exports: Converting SVG animations to a video format offers several advantages, including enhanced compatibility, easier sharing and distribution, improved playback control, offline accessibility, and greater flexibility for editing and post-processing. SVGator provides video file format export options for greater compatibility, supporting .mp4, .avi, .mov, .webm, and .mkv exports.

Animated image exports: The advantages include compatibility across various browsers, straightforward integration into presentations, applicability for social media and messaging, and reduced file sizes with formats like .gif, animated .png, .webp, and .zip.
