Coronary Stents Overview

Coronary stents are small, expandable tubes made of metal or polymer that are used to treat narrowed or blocked coronary arteries, which supply blood to the heart muscle. They are a key component of procedures like percutaneous coronary intervention (PCI), commonly referred to

as angioplasty.

Coronary Stents Market Dynamics

According to data from the British Heart Foundation published in January 2024, around 620 million people worldwide were living with heart disease as of early 2024. Additionally, the same source reported that approximately 250 million individuals suffered from coronary heart disease (CHD) in 2021. This escalating burden of cardiovascular conditions can be alleviated through the appropriate use of coronary stents, which are medical devices designed to keep arteries open and ensure a continuous flow of blood to the heart muscle. By maintaining optimal blood circulation, coronary stents can substantially reduce heart damage and improve health outcomes, thereby driving market growth.
