Metastatic Prostate Cancer Marketed Drugs

- NUBEQA (darolutamide): Bayer

NUBEQA (darolutamide) is an oral androgen receptor inhibitor with a distinct chemical structure that binds to the receptor with high affinity and exhibits strong antagonistic activity, inhibiting the receptor function and the growth of prostate cancer cells. NUBEQA is indicated for treating adult patients with non-metastatic castration-resistant prostate cancer and metastatic hormone-sensitive prostate cancer in combination with docetaxel.

- ERLEADA (apalutamide): Janssen

ERLEADA is a next-generation oral androgen receptor inhibitor that blocks the androgen-signaling pathway in prostate cancer cells. ERLEADA inhibits the growth of cancer cells in three ways: by preventing the binding of androgen to the androgen receptor, by stopping the androgen receptor from entering the cancer cells, and by preventing the AR from binding to the DNA of the cancer cell. It is indicated for treating patients with non-metastatic castration-resistant prostate cancer and metastatic hormone-sensitive prostate cancer.

Emerging Metastatic Prostate Cancer Drugs

- MGC018 (vobramitamab duocarmazine): MacroGenics

MGC018 (vobramitamab duocarmazine) is an investigational ADC comprised of a humanized B7-H3 mAb conjugated via a cleavable linker to the prodrug Seco-DUocarmycin hydroxyBenzamide Azaindole (DUBA). MacroGenics began enrolling the TAMARACK Phase II study of vobramitamab duocarmazine (vobra duo) in patients with mCRPC under an amended protocol during the second quarter. This study is designed to evaluate vobra duo at two different doses, 2.0 mg/kg or 2.7 mg/kg every 4 weeks, across 100 patients. MacroGenics is also evaluating the activity of MGC018 plus lorigerlimab (an investigational PD-1 × CTLA-4 bispecific DART® molecule) in a Phase 1 study in patients with advanced solid tumors.

- Bavdegalutamide (ARV-110): Arvinas

ARV-110 is an oral PROTAC protein degrader that targets the androgen receptor for potentially treating men with mCRPC and who have progressed on existing therapies. ARV-110 has demonstrated activity in preclinical models of androgen receptor mutation or overexpression, both common mechanisms of resistance to currently available androgen receptor-targeted therapies. The company plans to initiate a global Phase III trial with a confirmed bavdegalutamide dose in metastatic castration-resistant prostate cancer (mCRPC) for patients with AR T878/H875 tumor mutations by the First half of 2024.

Metastatic Prostate Cancer Market Outlook

Metastatic Castration-Resistant Prostate Cancer (mCRPC) is a stage of prostate cancer that has spread to other parts of the body, such as lymph nodes or bones, and no longer responds to treatment that lowers testosterone. Despite currently approved therapeutics, mCRPC remains a terminal diagnosis with an aggressive disease course. ADT is a stalwart therapy for the initial treatment of metastatic disease. Unfortunately, most men in this situation will go on to develop mCRPC and require secondary systemic therapy. This disease state can be very challenging to treat.
