## Trichomoniasis Overview

Trichomoniasis is a common sexually transmitted infection (STI) caused by the parasite *Trichomonas vaginalis*. It primarily affects the urogenital tract, and while many infected individuals may be asymptomatic, symptoms can occur within 5 to 28 days after exposure. In women, trichomoniasis can cause vaginal itching, burning, redness, and a frothy, yellow-green discharge with an unpleasant odor. Men may experience urethral discharge, burning during urination, or irritation inside the penis, although they often show no symptoms.

Trichomoniasis Diagnosis involves a physical examination, laboratory tests of vaginal or urethral secretions, and rapid antigen or nucleic acid amplification tests (NAATs). Treatment typically involves a single dose of oral metronidazole or tinidazole, both highly effective at clearing the infection. Sexual partners should also be treated simultaneously to prevent reinfection.

Preventative measures for Trichomoniasis include practicing safe sex, using condoms, and regular STI screenings for sexually active individuals. Untreated trichomoniasis can lead to complications, such as increased susceptibility to other STIs, including HIV, and in pregnant women, it may cause preterm delivery and low birth weight. Public health efforts focus on education, routine screening, and accessible treatment to control the spread of trichomoniasis.
