### Fibromyalgia Overview

Fibromyalgia is a chronic condition characterized by widespread pain, tenderness, and stiffness in muscles, ligaments, and joints throughout the body. It is often accompanied by other symptoms such as fatigue, sleep disturbances, memory problems (often referred to as "fibro fog"), and headaches. The exact cause is unknown, but it is believed to involve an abnormal response to pain signals in the brain and nervous system. Stress, infections, and physical trauma may trigger or worsen the condition. While there is no cure, treatment options focus on symptom management through medications, lifestyle changes, and physical therapy.
