Driving Forward with Pediatric Growth Hormone Deficiency GHD

The increasing prevalence of pediatric growth hormone deficiency GHD has emerged as a fundamental driver for the ngenla market growth. GHD in children is characterized by an inadequate secretion of growth hormone, which can impact physical growth and overall health. The prevalence of GHD is on the rise due to improved awareness, enhanced diagnostic capabilities, and increased access to healthcare services globally.

Ngenla, a long-acting recombinant human growth hormone somatrogen, is a key player in addressing pediatric GHD. It provides a sustained, consistent release of the growth hormone through once-weekly injections. This practice reduces the burden of daily administration, improving adherence, and effectively stimulating growth in children with insufficient growth hormone production.
