

RESEARCHERS FIND THAT THE PREVALENCE OF POST-TRAUMATIC STRESS DISORDER (PTSD) AMONG VETERANS OF THE 2003-2011 IRAQI WAR IS 18.6%.

PTSD prevalence among veterans of the 2003-2011 Iraqi War is 18.6%, according to a new study published in the Journal of the American Academy of Child and Adolescent Psychiatry.

RIYADH, RIYADH, SAUDI ARABIA, June 13, 2025 /EINPresswire.com/ -- Researchers have found that the prevalence of post-traumatic stress disorder (PTSD) among veterans of the 2003-2011 Iraqi War is 18.6%.

PTSD prevalence among veterans of the 2003-2011 Iraqi War – 28 June 2025

The study, which was conducted by a team of researchers from the University of California, San Diego, found that the prevalence of PTSD among veterans of the 2003-2011 Iraqi War is 18.6%. This is a significant finding, as it suggests that a significant portion of veterans of the 2003-2011 Iraqi War may be experiencing PTSD. The researchers also found that the prevalence of PTSD among veterans of the 2003-2011 Iraqi War is significantly higher than the prevalence of PTSD among veterans of the 1991 Persian Gulf War.

The researchers also found that the prevalence of PTSD among veterans of the 2003-2011 Iraqi War is significantly higher than the prevalence of PTSD among veterans of the 1991 Persian Gulf War. This finding is important because it suggests that the 2003-2011 Iraqi War may have had a more significant impact on the mental health of veterans than the 1991 Persian Gulf War. The researchers also found that the prevalence of PTSD among veterans of the 2003-2011 Iraqi War is significantly higher than the prevalence of PTSD among veterans of the 1991 Persian Gulf War.
