On the other hand, peritoneal dialysis (PD) uses peritoneal dialysis to filter blood when the kidneys are not working properly. This procedure is usually done at the patient's home and first removes excess fluid and toxins from the patient's blood. In PD, a catheter is inserted into the patient's abdomen and a dialysis solution (dialysate) is added to collect and remove waste products from the body. Dialysate absorbs toxins and fluids from the blood, using the peritoneum as a filter. Peritoneal dialysis is given regularly or intermittently. For patients with poor kidney function, medical professionals recommend continuous PD.
