# New Study Reveals U.S. Academic Transcription Market Trends 2025 to 2035

DENVER, CO, UNITED STATES, August 15, 2025 /EINPresswire.com/ -- A fresh study from Ditto Transcripts shines a light on how academic transcription services in the United States will grow from 2025 to 2035. The work draws on broad data and real trends to show how spoken words in classrooms and research studies become written text that all can use. The study avoids fancy words or fancy claims and looks to real needs. It shows the ways schools are starting to rely more and more on academic transcription services as they move more of their programs online and work to meet access rules.

Academic Transcription Market Growth Scenarios (2025-2035)

The study starts by defining academic transcription. This is the act of turning classroom audio and video, and research interviews and focus groups into clear text. It plays a big role in helping students and staff keep track of what is said in lectures, panels, and interviews. It helps those with hearing disabilities or who those who learn best reading instead of listening. It also serves those who do research and absolute accurate data of what was said in their interviews. The work shows that in 2025, as more colleges and universities use tools that stream or record class, the need for this kind of service is growing fast.

Ben Walker, CEO of Ditto Transcripts, said, "We see clearly that schools need accurate transcripts to meet growing demands for online education. Students and staff depend on text they can trust, and that's exactly what we offer."

The next part looks at how much this part of the market is worth right now. The total U.S. text from speech market is about two billion dollars in the academic and research worlds. That is a

small part of the whole at thirty billion, and one that is growing fast as schools shift to more online and mixed class modes. Many of the funds are now aimed at college and grad school needs, where recorded lectures, focus groups, and screens are becoming the norm. K–12 is growing as well, and is a part of the new wave of growth in the [academic transcription services market](#).
The study then lays out the key forces behind this growth. First, more schools use remote class tools and record what is said so students can catch on later. That need for accurate data makes the case for how and why research departments and students utilize [research transcription services](#). Second, there are a few laws and codes that require schools to make classes available to everyone, including those with disabilities.

Ditto Transcripts

Where things go next is clear in the market forecast. From 2025 to 2035, the academic transcription market may grow at a steady five to six point five percent each year. That means it may more than double by 2035.

Walker added, "Schools know the true cost when picking a transcription provider. Many services use AI software to cut costs, but fixing errors in the AI generated transcripts ends up costing schools way more in the long run. Human transcriptionists work is still the best way to make sure the job is done right."

The study also maps out who offers what in this space. There are three ways to offer this service. The first one is all human produced transcripts. It is more expensive upfront, but is the best for 99% accurate transcripts and no editing needed by the end users. The next is all AI speech to text based transcripts. It is quick and very cheap. The last is a mix or AI text to speech combined with human editing. The combination of AI and humans is the middle of the cost spectrum and accuracy rates.

For more on this topic of how academic and research transcription services will shape our colleges and universities for the next ten years and beyond, check out Ditto Transcripts' blog post at Academic Transcription Services Market 2025–2035.
