

PagePeek Unveils AI Professor, an Academic Evaluation System with Customizable Rubrics and Scoring

London-based platform announces AI Professor, providing structured feedback across multiple academic levels.

LONDON, UNITED KINGDOM, UNITED KINGDOM, September 25, 2025 /EINPresswire.com/ -- Academic writing often involves uncertainty. Are arguments logically developed? Are references accurate? Will supervisors consider the analysis sufficient? Addressing these concerns, London-based platform [PagePeek](#) has introduced [AI Professor](#), an evaluation tool designed to provide structured and transparent feedback before submission.

“

As AI becomes part of higher education, tools like AI Professor can improve fairness and efficiency in evaluation.”

*Academic Technology Advisor,
PagePeek*

Six-Dimensional Evaluation

□ Unlike grammar checkers, AI Professor applies a framework aligned with international academic standards. It reviews:

- Structure and logic
- Theoretical depth
- Data and evidence
- Critical analysis
- Language and fluency

□ References and formatting

□ Feedback goes beyond surface-level corrections, offering detailed evaluations of academic rigor and citation reliability.

Key Features

- Customizable rubrics: Users can upload course-specific grading criteria or apply default standards modeled on leading universities.
- Tiered assessment: Adaptable for undergraduate essays, postgraduate theses, doctoral research, and journal submissions.

☐Transparent scoring: Reports display reasoning processes, including citation tracking and logic mapping.

☐Knowledge base integration: For users who maintain personal literature databases within PagePeek, AI Professor draws on this material to provide discipline-specific commentary.

Workflow and Reporting

The evaluation process involves uploading a document, selecting academic level, and applying grading rubrics. Within minutes, a report is generated, including overall scores, sectional evaluations, and paragraph-level feedback with suggestions for revision.

Intended Users

The system is designed for:

- 1.Students preparing dissertations or coursework
- 2.Researchers submitting manuscripts to journals
- 3.Supervisors and teaching teams seeking scalable initial feedback tools

Conclusion

AI Professor is intended as a support mechanism in academic writing. While not replacing human mentorship, it offers a consistent and structured evaluation framework to help align drafts with established academic standards.

About PagePeek

PagePeek is a London-based academic technology platform integrating ideation, research, writing, and evaluation modules. Its flagship tools are designed to support students, researchers, and institutions in producing work that meets academic expectations of rigor, clarity, and integrity.

How Do Solar Farms Influence Biodiversity in Local Ecosystems?

1. Introduction

Solar farms are increasingly integral to sustainable energy solutions, reshaping landscapes and emerging discourses surrounding their ecological impact. Examining how solar farms influence local biodiversity is vital for harmonising energy production with environmental preservation, especially given the potential clashes with sensitive ecosystems and species. Investigating this impact is crucial for informed policy and sustainable energy practices (Davison et al., 2021; Watson et al., 2021; Carvalho et al., 2024).

1.1 Overview of Solar Farms

Solar farms, comprising land dedicated to producing electricity via solar panels, are increasingly vital in our pursuit of sustainable energy. As global awareness of climate change intensifies, the demand for renewable energy sources, particularly solar power, has surged. This evolution highlights the urgent need to assess how solar farms affect local biodiversity. These installations can significantly alter surrounding ecosystems, potentially benefiting or harming local wildlife, depending on management practices (Watson et al., 2021; Davison et al., 2021). Understanding these dynamics is essential for developing integrated approaches that harmonise ecological conservation with energy production. Research indicates that, when managed correctly, solar farms can provide unique habitat opportunities, showcasing their potential dual role in sustainable energy and environmental stewardship (Carvalho et al., 2024). Moreover, the effects of land conversion for solar development should be critically examined to mitigate adverse impacts on local biodiversity (Lusar et al., 2023).

1.2 Importance of Biodiversity

Biodiversity, which includes species diversity, ecosystem variety, and genetic variability, is critical for ecosystem services vital to human life, such as food production and climate regulation (Davison et al., 2021). Rich biodiversity enhances agricultural productivity and provides cultural and recreational benefits, thereby improving overall human wellbeing (Watson et al., 2021; Carvalho et al., 2024). In solar developments, integrating biodiversity can mitigate ecological disruptions, fostering sustainable energy practices (Boscaino-Gastano et al., 2024).

2. Literature Review

This literature review evaluates 15 scholarly sources to explore the historical context of solar energy, its biodiversity impacts, and the diverse methodologies employed. Findings illustrate both the positive and negative implications solar farms have on local ecosystems, highlighting the need for comprehensive assessment and sustainable practices (Davison, 2021; Carvalho, 2024).
