

Bigeye Expands Data Quality with Advanced Enterprise-Ready Features

Custom dimensions, cross-database join rules, and column-level asset linking modernize enterprise data management without losing existing data quality value.

SAN FRANCISCO , CA, UNITED STATES, October 1, 2025 /EINPresswire.com/ -- Bigeye, the leading enterprise data observability platform, today announced a new set of advanced data quality features designed to help enterprises modernize their data management practices while continuing to leverage the rules and processes they already rely on.

These new enhancements include customizable data quality dimensions, join-based rules across databases, and column-level asset linking—enabling enterprises to embrace the benefits of data observability without losing the value of their existing body of data quality rules.

“

Enterprises don't want to throw away years of investment in data quality. These new capabilities let companies carry forward existing rules and processes, unlocking advanced observability benefits.”

Kyle Kirwan, Chief Product Officer at Bigeye

CUSTOMIZABLE DATA QUALITY DIMENSIONS

Bigeye now allows customers to tailor how data quality is defined and reported within their organizations. While the platform includes core dimensions such as pipeline health, completeness, uniqueness, validity, and distribution, enterprises can now configure which metrics and rules roll up into each category. This flexibility helps teams ensure that data quality reporting reflects their unique governance and compliance requirements.

JOINS AND JOIN RULES

With support for joins across multiple tables—even spanning different databases—Bigeye enables the creation of rules that capture data quality issues that only emerge in relationships between datasets. Enterprises can now enforce integrity checks across systems, ensuring that

joined data remains accurate and trustworthy throughout the data lifecycle.

ASSET LINKING FOR PRECISION REPORTING

Bigeye's new asset linking capability makes it possible to associate specific metrics and rules with individual columns. For example, a rule involving multiple tables can be reported only against a critical data element (CDE) that resides in one of the tables, ensuring that data quality results for that CDE align with existing reporting structures.

MEETING ENTERPRISE NEEDS TODAY AND TOMORROW

These innovations are helping large enterprise organizations migrate from legacy data quality platforms onto Bigeye for data observability. By delivering compatibility with existing rules while introducing more advanced data observability capabilities, Bigeye helps enterprises not only preserve the value of their current investments but also accelerate their transition to a more automated and scalable future.

"Enterprises don't want to throw away years of investment in legacy data quality practices just to modernize," said Kyle Kirwan, Chief Product Officer at Bigeye. "With these new capabilities, Bigeye makes it possible to carry forward existing rules and processes while also unlocking the benefits of advanced data observability."

Enterprises can now gain the best of both worlds - preserving institutional knowledge in data quality while positioning their data quality strategy for the future by leveraging a scalable data observability platform.

About Bigeye

Bigeye is the data observability platform for large enterprises. Bigeye helps data teams in some of the world's largest companies detect, prioritize, and resolve data incidents before they impact the business. Only Bigeye has data observability that is powered by comprehensive data lineage and AI-driven resolution and prevention to improve data reliability across modern, legacy and hybrid data stacks. Bigeye is trusted by top enterprise organizations such as USAA, Zoom, Hertz, Cisco and Freedom Mortgage to ensure the data powering their business stays reliable by default.
