

A First-of-Its-Kind Non-Surgical Procedure is Now in Clinical Trials

MINNEAPOLIS, MN, UNITED STATES, October 10, 2025 /EINPresswire.com/ -- Type 2 diabetes is one of the most significant health challenges in the U.S., affecting more than 34 million Americans — with nearly 9 million undiagnosed. Left unmanaged, the disease can lead to serious complications including heart disease, kidney failure, vision loss, nerve damage, and amputation.

While there's no cure for Type 2 diabetes, researchers at Endogenex - a clinical-stage medical device company - are studying a new non-surgical procedure that uses controlled electric pulses to regenerate healthy cells in the duodenum, the top part of the small intestine. By restoring the gut, the treatment aims to slow or even stop disease progression.

Dr. Richard Pratley discusses why Type 2 diabetes is a growing health concern in the U.S., explain how the new investigational procedure works, and share early study results. They also provide details on how people with Type 2 diabetes nationwide can participate in the research.
