Termite Damage and the Cost Involved

Termites tend to compromise the structural integrity of your homes. To understand the cosmetic

damages termites can potentially create, one has to know these invaders, their types, and the different stages of their lifecycle. For instance, subterranean termites, the most common type found in the U.S., build their colonies underground. On the other hand, less common, the damp wood termites prefer wood with high moisture content and are usually found in damp or decaying wood. Dry wood termites, unlike subterranean termites, do not require contact with soil and impact the wooden attics and furniture. Additionally, walls get hollowed out with these deadly pests making them weaker and more likely to collapse.
