MindMap AI Removes Barriers to Visual Thinking With Faster Documents, Invite-Only Sharing, and Multilingual Support
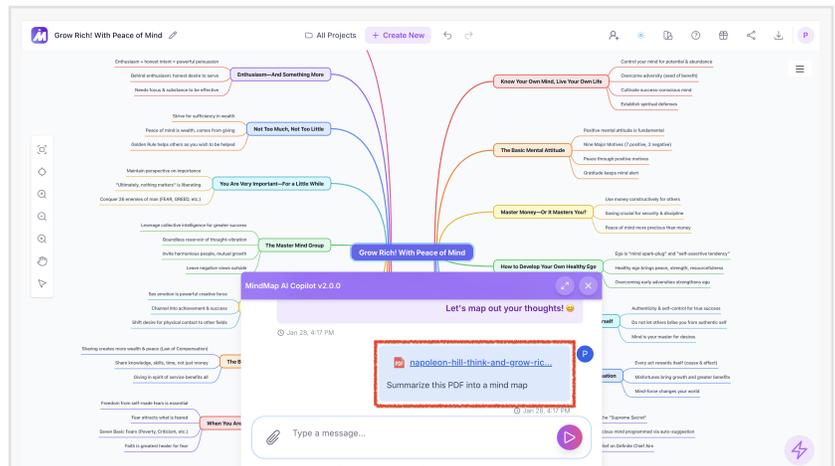

New updates help users turn documents into structured mind maps faster, share live maps securely, and think visually in their native language.

DE, UNITED STATES, January 28, 2026 /EINPresswire.com/ -- Turning information into clear thinking shouldn't require hours of manual organization. Yet for students, professionals, and researchers, working with documents, sharing ideas, and structuring knowledge often becomes a slow, fragmented process.
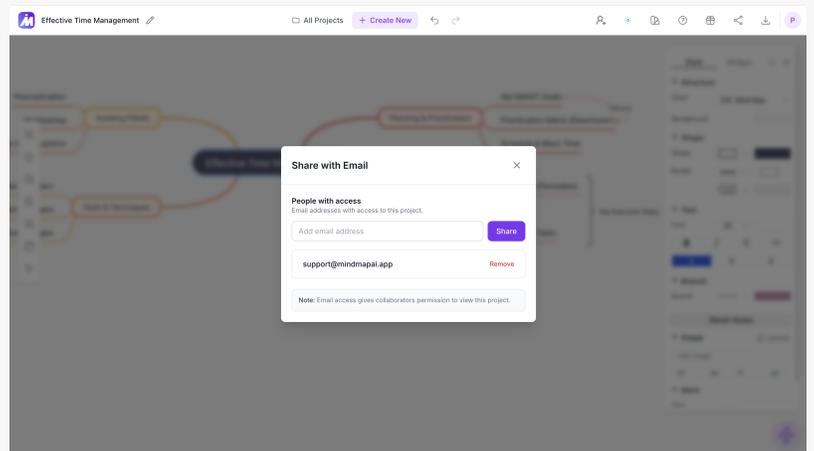

MindMap AI today announced a new set of product upgrades focused on removing those barriers: faster and more accurate document processing, invite-only live sharing for mind maps, and multilingual support for native-language visual thinking . Together, these updates help users move from raw information to structured understanding with less friction so they can focus on ideas, not formatting.

MindMap AI Faster Document Processing

MindMap AI Invite-Only Live Sharing That Stays in Sync

MindMap AI's document summarizing has been significantly improved to generate clearer structures with greater accuracy and speed. Users can upload a document and instantly receive a clean hierarchical outline that serves as the foundation for a mind map ready to expand, reorganize, and refine.

Instead of manually reading and outlining lengthy files, users can quickly transform research
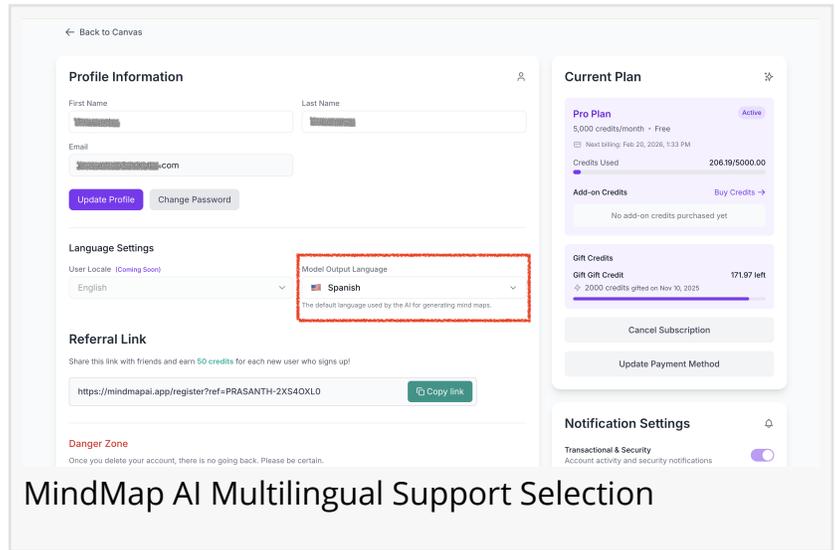

papers, reports, meeting notes, strategy documents, and long-form articles into structured visual maps. This makes it easier to study complex material, synthesize information, and prepare content for presentations or reviews.

MindMap AI Multilingual Support Selection

MindMap AI previously supported snapshot-based sharing, where a static version of a mind map could be shared without reflecting future changes. With this release, MindMap AI introduces live, up-to-date sharing designed for more controlled and meaningful access.

Creators can now invite specific people to view a mind map. Even if someone has the link, they won't be able to access it unless they've been invited, giving users tighter control when sharing with teams, classmates, or clients. Updates made by the owner are reflected instantly for invited viewers, ensuring everyone sees the latest version.

MindMap AI is also actively working toward deeper collaboration features that will evolve shared maps into true team workspaces over time.

MindMap AI now supports full multilingual workflows, allowing users to chat with AI and create mind maps entirely in their native language—without translating ideas into English.

Key capabilities include:
- Multilingual AI Chat: for natural, context-aware interactions
- Native-Language Mind Maps: that preserve structure and clarity
- Seamless Language Switching: while keeping existing content intact

The initial release supports 19 languages : English, Japanese, Indonesian, Greek, Malay, Russian, Czech, Ukrainian, German, Thai, Spanish, Korean, French, Simplified Chinese, Traditional Chinese, Hungarian, Italian, Polish, and Portuguese. More languages will be added based on user demand.

Availability

Improved document processing, invite-only live sharing, and multilingual support are available now to MindMap AI users across web and mobile platforms.
