

Identity Management Institute Highlights Emerging Identity Security Risks in Connected Systems

New analysis reveals emerging security challenges and solutions as organizations rely more on connected systems and digital services.

LOS ANGELES, CA, UNITED STATES, April 7, 2026 /EINPresswire.com/ -- The [Identity Management Institute \(IMI\)](#) has released new findings and solutions on emerging identity security trends, stressing that identity risks are not introduced by weak technologies but by how modern systems are implemented, connected, and integrated.

Identity Management Institute

According to IMI, most vulnerabilities exploited by attackers are not due to flaws in security standards or technologies themselves. Instead, they target misconfigurations, implementation gaps, and the complex relations between systems, applications, and third-party services.

Security is no longer simply about using the right technologies or complying with standards. It is about managing the entire identity and integration lifecycle.”
Identity Management Institute

Common attack methods include misuse of access tokens, social engineering, compromised third-party integrations, redirect-based attacks, account impersonation, poor identity data management, and weak access controls.

“Security is no longer simply about using the right technologies or complying with standards. It is about managing the entire identity and integration lifecycle,” IMI noted.

“Attackers are targeting the weakest points of the ecosystem, not the standards,” the organization added.

To reduce these risks, IMI recommends implementing strong access controls, applying the principle of least privilege, validating all access requests, continuously monitoring system activity, and strengthening defenses against social engineering.

As digital ecosystems continue to expand, organizations must adopt a comprehensive and proactive approach to identity and access management.
