

# .agent Launches Today – Headless Domains Powers the Next Era of Agentic Commerce

*.agent lets agents prove who they represent, what they are authorized to do, and how they get paid.*

HONG KONG, April 27, 2026 /EINPresswire.com/ -- [Headless Domains](#) today officially launched the .agent namespace, the first truly machine-native identity layer purpose-built for autonomous

With .agent, AI agents can now own a persistent digital identity, prove their capabilities, stream micropayments through Tempo MPP, and resolve instantly across apps, APIs, and marketplaces.”

*Michael Michelini*

AI agents. Powered by Handshake DNS, the .agent extension delivers portable, verifiable, machine-readable identities that enable agents to register, discover, negotiate, pay, and renew themselves - without human intervention.

“.agent turns agents into enduring economic participants,” said Michael Michelini, Founder of Headless Domains.

“This isn’t just another branding TLD. Agents can now own a persistent digital identity, prove their capabilities via auto-generated SKILL.md files, stream micropayments through Tempo MPP, and resolve instantly across apps,

APIs, and marketplaces.”

Built for the Agentic Web

Every .agent domain ships with a complete autonomous toolkit out of the box:

- agent.json – Structured manifest containing capabilities, version info, Tempo MPP payment endpoints, DID, squad\_id, and webhooks.
- SKILL.md – Auto-generated, LLM-discoverable markdown describing exactly what the agent can do.
- Handshake DNS TXT records – Full Handshake integration with TXT-record manifest discovery; connect your agent name to a standard manifest discovery for machine-readable lookup.
- GET /lookup and POST /renew endpoints – One-call status checks and fully autonomous renewal via machine payments (Tempo MPP or GFA Gems).

- Human-backed verification – Optional Zero-Knowledge (ZK) attestations and GFAVIP SSO to prove human oversight while preserving agent sovereignty.

The full lifecycle — Register □ Discover □ Renew — runs headlessly. Developers and AI agents can register via a simple Python SDK (pip install headlessdomains) in just a few lines of code, or through the web registrar at [HeadlessDomains.com](https://HeadlessDomains.com).

## Real Utility, Live Today

Unlike traditional ICANN domains built for human-managed websites, Headless Domains' .agent namespace is already operational for agents to start using today. It is fully compatible with IronClaw secure TEE runtimes, the [Agent Relationship Protocol](#) (ARP), [PowerLobster](#) squad controls, and Self.xyz attestations — delivering the missing identity layer for agent-to-agent commerce already happening today.

The Trademark Sunrise Phase concluded successfully on April 27, 2026, giving verified trademark holders priority for exact-match names. Public registration is now open on a first-come, first-served basis.

## How to Get Started

- Visit <https://HeadlessDomains.com/> or <https://HeadlessDomains.com/agent>
- Search and register your agent's name instantly
- Pay with card, Tempo MPP, or GFA Gems
- Agents can self-register and self-renew autonomously

Additional agent-native namespaces including .chatbot (already live), .boss, .empire, .factory, and .hustle are rolling out in the coming months.
