

# Vithy Launches High-Performance Automatic Backwash Filter as Shanghai High-Tech Enterprise Solution

JINSHAN, SHANGHAI, CHINA, April 27, 2026 /EINPresswire.com/ -- Shanghai Vithy Filter System Co., Ltd, an acclaimed Shanghai High-tech Enterprise, recently issued engineering standards that define their latest liquid treatment solutions for global industrial applications. At the forefront of this technological evolution lies the [High-Performance Automatic Backwash Filter](#), an impressive system designed to offer continuous filtration of low viscosity liquids without operational downtime. This innovative technology utilizes high-precision stainless steel wedge wire or perforated screen filters to capture impurities; when an accumulation

reaches a preset pressure differential threshold, a backwash cycle begins automatically to clean it out. By diverting part of the filtered fluid back through its filter, this equipment achieves optimal flow rates while operating entirely unattended - replacing traditional manual filtration methods which require frequent element replacement.

## The Trajectory of the Industrial Filtration Sector

Global industrial filtration landscape is currently experiencing a seismic transformation driven by environmental sustainability and efficiency demands. As more industries move toward "Smart Manufacturing," the reliance on manual filtration systems—which are prone to human error and high consumable waste—is rapidly declining. Market data suggests a significant rise in the adoption of automated separation technologies across the petrochemical, pharmaceutical, and water treatment sectors.

In the current regulatory climate, particularly within high-growth industrial hubs, enterprises are mandated to reduce their environmental footprint. This has led to a surge in the "Circular Economy" model, where process water and chemicals must be filtered and reused within a

closed-loop system. The filtration industry is responding by developing systems that not only remove finer particulates but also consume less energy and water during self-cleaning cycles. The integration of high-performance materials, such as Duplex stainless steel and titanium, has become a standard requirement to withstand the corrosive and high-temperature environments found in modern chemical processing.

Furthermore, the industry is seeing a trend toward the "Total Cost of Ownership" (TCO) model. Rather than focusing solely on the initial capital expenditure, global manufacturers are evaluating filtration solutions based on long-term savings in labor, spare parts, and waste disposal. This shift favors high-tech enterprises that can provide sophisticated, durable hardware integrated with intelligent control systems capable of communicating with a plant's central Distributed Control System (DCS).

#### Vithy's Core Competencies as a Technical Leader

Shanghai Vithy Filter System Co., Ltd. has positioned itself as a primary innovator within this evolving market. Founded in 2013 and headquartered in the high-tech industrial corridors of Shanghai, the company has achieved the status of a "specialized and sophisticated SME". This designation is reserved for companies that demonstrate a high degree of technical mastery and a consistent track record of research and development.

The company's competitive advantage is rooted in its integrated approach to fluid dynamics. Vithy does not merely manufacture hardware; it operates a dedicated R&D center and laboratory where liquid samples from clients are analyzed for particle size distribution, viscosity, and chemical compatibility. This ensures that the provided filtration system is calibrated precisely for the intended application, a necessity for the high-stakes environments of its primary client base.

Vithy's manufacturing infrastructure is equally robust, featuring a secondary production base in Jiangxi Province. By maintaining control over the entire production chain—from design and material sourcing to final pressure testing—the company ensures compliance with international quality standards, including ISO9001 and CE certifications.

#### Comprehensive Product Portfolio and Application Scenarios

Vithy has established itself as a provider of innovative solutions through their broad selection of specialty filtration equipment, each tailored specifically to specific industrial challenges: Scraper Self-Cleaning Filters: Utilizing a mechanical scraping mechanism, these filters have

become the industry standard when dealing with high viscosity liquids like coatings, resins and food oils, where traditional backwashing would not be successful.

**Candle Filters:** Candle filters are essential tools for thickening slurry in fine chemical and pharmaceutical industries, enabling the recovery of valuable solids through an enclosed automated system.

**WTF Precision Filters:** Engineered to deliver precise filtration performance, these systems are used when eliminating microcontaminants is crucial to product quality.

**Bag and Basket Filters:** For less intensive or batch-processing applications, Vithy provides high-durability manual systems that serve as reliable secondary filtration.

These products are deployed in several high-demand scenarios. In the Petrochemical Industry, Vithy systems protect expensive catalysts and heat exchangers from fouling. In Water Treatment, the High-Performance Automatic Backwash Filter is frequently used for pre-filtration in membrane systems (UF/RO) and for treating circulating cooling water in power plants. The Food and Beverage sector utilizes Vithy's sanitary-grade equipment to ensure the purity of ingredients like glucose, edible oils, and fruit juices, adhering to strict hygiene protocols.

### Strategic Client Partnerships and Proven Performance

The efficacy of Vithy's filtration solutions is validated by a portfolio of major global and domestic clients. The company has provided critical infrastructure to industry giants. These partnerships involve solving complex separation problems that require bespoke engineering.

For example, in large-scale chemical plants, Vithy's automated systems have been credited with significantly reducing manual labor and exposure to hazardous substances. By replacing manual bag filters with High-Performance Automatic Backwash Filters, plants have reported a drastic reduction in downtime and a more consistent output quality. This ability to deliver measurable operational improvements is what distinguishes Vithy as a high-tech enterprise rather than a traditional equipment vendor.

### Conclusion

The distinction of Shanghai Vithy Filter System Co., Ltd. as a high-tech enterprise solution provider is defined by its ability to merge advanced fluid engineering with the practical requirements of modern industry. Through the deployment of the High-Performance Automatic Backwash Filter and its broader portfolio of self-cleaning technologies, Vithy addresses the critical global trends of automation, resource conservation, and process optimization. By maintaining a rigorous focus on R&D and quality-controlled manufacturing, the company ensures that its systems provide the reliability required by the world's most demanding industrial sectors. As the industry continues to move toward more sustainable and intelligent liquid processing, Vithy's role in providing high-performance, unattended filtration solutions remains a cornerstone of its strategic growth.
