

# Trust3 AI Redefines Enterprise AI Security with Agent Control Plane and Unified Trust Layer

*One Control Plane for Any Agent and Data Source: Built for the Next Generation of Production AI.*

SAN FRANCISCO, CA, UNITED STATES, May 7, 2026 /EINPresswire.com/ -- [Trust3 AI](#) today announced its unified [control plane](#) for governing any agent and any data source.

Enterprises need more than isolated AI controls or legacy data governance tools. They need one control plane that can govern access & risk across every agent, model interaction, and every data source”

*Neeraj Sabharwal, Co-Founder at Trust3 AI*

This platform gives enterprises a single place to discover agents, monitor decisions, enforce policies, and secure actions across modern data and AI environments. Trust3 AI brings data governance and AI governance together into one unified architecture. Automated Trust Agents power this system to continuously control how agents access data, call tools, and act.

As organizations move from AI experiments to full-scale production, the challenge of bringing AI to production with a robust control plane becomes clear. Governance grows harder to manage across clouds, models, applications, and

autonomous agents. Trust3 AI is designed to solve this fragmentation. The platform provides a unified trust layer that supports instant agent discovery, real-time guardrails, and end-to-end auditability.

The launch comes as enterprises face a fast-changing regulatory environment for data and AI. Trust3 AI helps organizations operationalize governance expectations and supports readiness for evolving legal and policy expectations around privacy, transparency, human oversight, and risk management. Designed for the emerging governance requirements of agentic AI, the platform focuses on practical controls rather than overstating certification or regulatory approval.

Trust3 AI helps organizations operationalize these expectations with core capabilities:

- Unified governance across data and AI in a single platform.
- Automated Trust Agents for continuous monitoring and policy enforcement.
- Agent discovery and observability across the enterprise AI ecosystem.

- Natural-language policy creation and real-time guardrails for secure AI deployment.
- End-to-end audit ability, semantic enrichment, and purpose-based access controls for secure, vendor-agnostic deployment.

By unifying governance across agents and data, Trust3 AI helps enterprises strengthen security and reduce governance sprawl. The platform allows organizations to replace fragmented processes with an extensible trust layer that scales alongside modern data architectures.

## About Trust3 AI

Trust3 AI is a unified control plane for agent observability and governance that enables enterprises to govern access, usage, and risk across multi-cloud data environments and AI applications. Powered by autonomous Trust Agents, the platform provides instant agent discovery, natural-language policy creation, real-time guardrails, and end-to-end audit ability to secure and govern the entire data and AI ecosystem.
