

USA Fibroid Centers to Host National Webinar on Fibroids and Infertility Risks

Free national webinar offers hope to women facing fibroid-related infertility by highlighting advanced, non-surgical uterine preservation.

NEW YORK, NY, UNITED STATES, June 8, 2026 /EINPresswire.com/ -- In recognition of World Infertility Awareness Month, [USA Fibroid Centers](#) is premiering a national educational webinar, "Can Uterine Fibroids Cause Infertility? What You Need to Know," on Thursday, June 11, 2026, at 8:00

a.m.[EST]. The webinar debuts directly on the [\[USA Fibroid Centers' YouTube Channel Link\]](#) with no registration required, aiming to educate the public on how uterine fibroids serve as a frequently overlooked cause of unexplained infertility and difficulties conceiving.

“

This webinar is designed to show how benign tumors alter the uterine environment, so women can explore every factor and make the best decision for their future.”

Dr. Jacob White, Medical Director, USA Fibroid Centers

While many women experience heavy periods and severe cramping from fibroids, these benign tumors can also silently disrupt family planning. Clinical data show that uterine fibroids affect up to 80 percent of women by age 50, yet many remain unaware that these tumors may be the underlying cause behind unexplained conception struggles. A widespread misconception in women's healthcare suggests that invasive surgeries like a myomectomy or a hysterectomy are the only options for fibroid patients who wish to become pregnant.

During the session, Dr. Jacob White, USA Fibroid Centers’

Medical Director and Fibroid Specialist, breaks down how the size and location of these tumors directly impact reproductive health. Through the use of clear ultrasound and MRI images, the presentation provides a detailed visual guide on how fibroids can interfere with conception by physically blocking the fallopian tubes, distorting the shape of the uterine cavity to prevent successful embryo implantation, or altering critical blood flow to the uterine wall.

To ensure women have access to a full range of reproductive insights, Dr. White discusses the various paths available for managing fibroids while planning a family. While women typically consult their gynecologist for initial fertility evaluations and symptoms, specialized, non-surgical options like [Uterine Fibroid Embolization \(UFE\)](#) are performed by an interventional radiologist. During this minimally invasive, image-guided procedure, tiny particles are delivered through a small catheter to safely block the specific blood vessels feeding the fibroids. Deprived of blood supply, the tumors naturally shrink and die over time, while the surrounding healthy uterine tissue and overall structure of the uterus are fully preserved.

"When a woman is struggling to conceive, every month of uncertainty can feel overwhelming," said Dr. White. "Uterine fibroids are incredibly common, yet they are frequently overlooked during initial fertility evaluations. This webinar is designed to help women understand exactly how these benign tumors can alter the uterine environment, so they can explore every possible factor and make the best decision for their unique path forward."
