

Free IQ Test Publishes Data-Led Article Comparing Average IQ-Style Scores Across UK Nations

🔊 Listen to the Podcast Episode

London, UK – Free IQ Test has published a new data-led article examining average IQ-style scores across England, Scotland, Wales, and Northern Ireland. The article, hosted on the UK-focused platform at freeiqtest.uk, draws on both external data sources and the platform's own user results to compare cognitive performance across the four nations.

The analysis finds that Wales appears to have the lowest average IQ among the four UK nations in both datasets. However, the differences separating the nations are small, and the article frames the findings as an interesting snapshot rather than a definitive ranking.

What the Article Covers

The new piece compares average scores using two sources: publicly available external data and results gathered from users who have taken the Free IQ test with instant results on the platform. Both datasets point to Wales recording the lowest average, but the article notes that sample sizes, demographic representation, and the inherent limitations of IQ-style testing all affect the reliability of direct comparisons. The scores reflect performance on specific cognitive tasks, abstract reasoning, pattern recognition, and mental flexibility rather than formal education, subject-specific knowledge, or broader intelligence.

A Responsible Approach to Regional Data

The article avoids sensationalism and explicitly cautions against using regional IQ statistics to reinforce stereotypes. Rather than presenting the findings as a competition between nations, the piece contextualizes them as data points that invite curiosity, not judgment. This framing distinguishes it from clickbait-style coverage that often accompanies regional comparison data. A representative from Free IQ Test said: "Wales showed the lowest average in both the external data and our own user results, but the margins are genuinely small. These figures represent performance on a specific set of cognitive tasks on a given day — they are not a measure of a nation's character, education system, or potential. We published this article because the data is interesting, but we want readers to engage with it responsibly. Regional IQ statistics carry real limitations, and we believe they should be treated as a conversation starter, not a basis for stereotypes."

Accessible Testing Without Barriers

The article is published alongside the platform's existing free assessment, which requires no registration, account creation, or email address. Users who want to see how they personally score can take the test immediately and receive instant results with no payment or additional steps required. User answers and results are kept private and are not shared with third parties,

ensuring that anyone across all four nations can engage with the data on a personal level without compromising their privacy.

What the Test Measures

The IQ-style assessment used to generate the platform's user data measures general cognitive abilities, including abstract reasoning, numerical reasoning, verbal understanding, spatial thinking, and mental flexibility. It does not test formal education or subject-specific knowledge. This distinction is relevant to the article's findings: the regional differences reflect performance on a particular set of cognitive tasks, not differences in schooling or qualifications.
