Market Size and Growth Outlook for the Intraoral Cameras Market

The intraoral cameras market has seen rapid growth in recent years, with its size projected to increase from \$1.9 billion in 2025 to \$2.11 billion in 2026, representing a compound annual growth rate (CAGR) of 10.7%. This historical growth is largely due to digital transformation in dental clinics, a rising incidence of dental diseases, greater use of visual diagnostic tools, expansion of private dental care providers, and more affordable dental imaging technology. Looking ahead, the market is expected to grow even faster, reaching \$3.11 billion by 2030 with a CAGR of 10.2%. This future expansion is driven by growing demand for cosmetic dentistry, AI integration in dental diagnostics, the rise of teledentistry services, a stronger emphasis on preventive oral care, and increased adoption of chairside digital imaging systems. Key trends forecasted to influence the market include the use of high-resolution imaging cameras, wireless and portable intraoral devices, seamless integration with dental software, enhanced patient education tools, and ergonomic designs improving clinician comfort.

What Intraoral Cameras Are and How They Are Used

Intraoral cameras are small, high-definition devices equipped with light sources that dentists use

to inspect various areas inside the mouth. These cameras help detect dental issues like cavities or cracks that may not be visible on traditional X-rays. They also serve as an educational tool by providing patients with real-time images of their oral health, making it easier for them to understand their dental conditions and participate actively in treatment decisions.

Factors Fueling Growth in the Intraoral Cameras Market

One major factor driving the expansion of the intraoral cameras market is the increasing prevalence of dental caries, a disease caused when mouth bacteria convert sugars into acids that erode tooth tissues. Intraoral cameras are especially effective in identifying caries and cracks that often go undetected by standard radiographs, aiding in early diagnosis and treatment. For example, data published in March 2025 by the UK's Office for Health Improvement and Disparities revealed that during 2023 to 2024, 5-year-old children living in the most deprived areas were more than twice as likely (32.2%) to have suffered dentinal decay compared to those in the least deprived areas (13.6%). This rise in dental caries cases is a significant factor boosting the demand for intraoral cameras.
