Telesystem Launches TelesystemEC, Empowering Businesses to Build a More Resilient, Secure Network

New Engineered Connectivity bundles combine business internet with integrated protection, continuity, and exclusive bundled savings.

TelesystemEC offers businesses a cost-effective way to boost network resilience and security, while simplifying the purchase management, and support of critical services.

NORTHWOOD, OH, UNITED STATES, September 22, 2026 / EINPresswire.com/ -- Telesystem, a leading provider of nationwide managed security, networking, and communications solutions, today announced the launch of TelesystemEC, a portfolio of intelligently engineered connectivity bundles designed to keep businesses online, protected, and operational.

TelesystemEC goes beyond simply providing bandwidth. By combining a Dedicated or Broadband Internet connection with complementary technologies that improve uptime, strengthen security, and simplify IT management - all backed by Telesystem's trusted 24/7 U.S.-based support team.

"As businesses grow increasingly dependent on cloud applications, digital communications, and online transactions, choosing an internet connection based on price alone is a significant risk." said James Maloney, President of Telesystem. “The real cost of connectivity becomes clear when a business faces downtime, a security incident, or inadequate support. TelesystemEC brings connectivity, reliability, security and support together in one integrated solution designed to keep businesses connected and protected.”

The Engineered Connectivity portfolio offers three purpose-built bundles designed around a variety of business priorities, each combining complementary connectivity technologies at exclusive bundled pricing:

• TelesystemEC Resilience - Designed for organizations where downtime isn't an option, this solution combines business broadband or dedicated internet with automatic 4G LTE failover to help maintain connectivity during outages.
• TelesystemEC Protection – Designed for businesses focused on cybersecurity, this solution combines internet connectivity with a fully managed firewall solution that delivers proactive protection, continuous monitoring, and simplified security management.
• TelesystemEC Continuity - The most comprehensive offering, combining automatic LTE failover and managed firewall protection to deliver resilient, secure connectivity for organizations that rely on always-on operations.

Together, the bundles offer businesses a more cost-effective way to boost network resilience and security, while simplifying the purchase management, and support of critical services. Each bundle features Telesystem's 100% uptime guarantee, integrated DDoS protection, proactive monitoring, and access to Telesystem's 24/7/365 U.S.-based support team. By bringing these capabilities together through a single provider, businesses can reduce the complexity of managing multiple vendors while gaining a more cohesive approach to connectivity and network protection.

Although bundled connectivity offerings have become increasingly common in the marketplace, Telesystem differentiates TelesystemEC through an integrated approach in which each component is engineered to work together as a unified solution.

Rather than packaging standalone products together, TelesystemEC is engineered from the ground up by Telesystem network architects to ensure every component works seamlessly together while aligning with each customer's operational requirements, business goals, and risk profile.

"There's a significant difference between bundled products and engineered solutions," Maloney continued. "Every business has unique applications, compliance requirements, locations, and uptime expectations. We take the time to understand those needs and design a connectivity solution that supports the way they operate today while preparing them for the future."

TelesystemEC is ideal for organizations that rely on uninterrupted connectivity for cloud applications, hosted communications, payment processing, inventory platforms, and other mission-critical operations where downtime or security incidents can have a significant business impact.

With one provider, one bill, and one support team, businesses gain a simplified technology experience while reducing vendor complexity and improving operational resilience.
