Two Ways to Get Started with Numverify

Developers can access Numverify through its dedicated website or APILayer, with flexible sign-up options for phone number validation.

phone number validation API

AUSTIN, TX, UNITED STATES, November 27, 2026 /EINPresswire.com/ -- Developers now have two ways to get started with Numverify: through its dedicated website or through APILayer. Both routes provide access to Numverify's phone number validation API, while APILayer makes it easier to bring complementary APIs into the same development workflow.

Choose your sign-up route

> Developers can choose the Numverify sign-up experience that best fits their workflow, with APILayer offering access to complementary APIs through one account."
>
> *APILayer*

Numverify helps applications validate phone-number formats and retrieve available country, carrier, location and line-type information. These checks support registration forms, contact-data quality, lead qualification and messaging workflows.

A. Sign up directly at Numverify.com

Choose Numverify.com if you prefer the dedicated product experience. Create an account, use the dashboard associated with that account, and integrate using its API key and documentation. This option remains available to new and existing customers.

B. Sign up through APILayerSign up through APILayer

Choose Numverify on APILayer if you also use, or plan to explore other APIs. You can add supported APIs to one APILayer account, use a single API key across them, and manage their subscriptions and usage from one unified dashboard. Each API has its own subscription and usage limits.

Why use Numverify on APILayer

Why use Numverify on APILayer

- A single API key across your APILayer account: Use your APILayer key with every API you activate from the API suite, subject to individual subscriptions and quotas.
- Centralized management: Review API subscriptions and usage from the APILayer dashboard.
- Related verification and data services: Explore email validation, geolocation and country reference APIs that can complement phone-number checks.

For example, consider an international signup flow that collects a phone number and email address. Numverify can check the phone number and return available carrier or line-type details. Mailboxlayer can assess email syntax, domain records and deliverability signals. IPstack can add IP-based location and network context to the same onboarding workflow.

If these APIs are added to an APILayer account, your application can call each service using the same API key. That keeps credentials and API management simpler as your use case expands, while letting you decide which checks matter for your users. On their own, these checks add validation and context; they don't verify a person's identity.

What changes for existing Numverify users?

What changes for existing Numverify users?

If you already use Numverify.com, there is no required migration. Continue signing in through your existing account and using your current subscription, API key and integration.

New customers can choose either signup route. The dedicated Numverify and APILayer account systems use separate credentials and API keys, so follow the authentication instructions for the platform you select. Numverify's core validation functionality and existing integrations are unchanged by this announcement. Plans cost the same on both routes, from a free tier of 100 requests a month up to 250,000 requests for $129.99 a month.

How to get started with Numverify

How to get started with Numverify

For the standalone product, go to Numverify.com and follow the Numverify getting-started guide. For an APILayer account, open Numverify on APILayer, sign up, and use the APILayer Numverify documentation to configure your first API request.

Use the API key and request URL documented for your chosen account. Test with a sample number, examine the returned validation and metadata fields, and decide how your application will handle incomplete or uncertain results.

Choose the Numverify signup experience that works for you, and explore APILayer when your next workflow calls for more than phone-number validation.
